

AP Calculus Mock Exam

AB 1

The continuous function f has domain $-2 \leq x \leq 9$. The graph of f , consisting of three line segments and two quarter circles, is shown in the figure.

Graph of f

Let g be the function defined by $g(x) = \int_0^x f(t) dt$ for $-2 \leq x \leq 9$.

- Find the x -coordinate of each critical point of g on the interval $-2 \leq x \leq 9$.
- Classify each critical point from part (a) as the location of a relative minimum, a relative maximum, or neither for g . Justify your answers.
- For $-2 \leq x \leq 9$, on what open intervals is g increasing and concave down? Give a reason for your answer.
- Find the value of $g(-1)$. Show the computations that lead to your answer.
- Find the value of $g(2)$. Show the computations that lead to your answer.
- Find the absolute maximum value of g over the interval $-2 \leq x \leq 5$.
- Find the value of $g''(6)$, or explain why it does not exist.
- Must there exist a value of d , for $0 < d < 2$, such that $g'(d)$ is equal to the average rate of change of g over the interval $0 \leq x \leq 2$? Justify your answer.
- Find $\lim_{x \rightarrow 0} \frac{3x + g(x)}{\sin x}$. Show the computations that lead to your answer.
- The function h is defined by $h(x) = x \cdot g(x^2)$. Find $h'(\sqrt{2})$. Show the computations that lead to your answer.

Solution	Scoring										
<p>(a) $g'(x) = f(x) = 0 \Rightarrow x = -1, 2, 7$</p>	<p>1: answer</p>										
<p>(b) At $x = -1$, g has a relative maximum because $g'(x) = f(x)$ changes from positive to negative there.</p> <p>At $x = 2$, g has a relative minimum because $g'(x) = f(x)$ changes from negative to positive there.</p> <p>At $x = 7$, g has neither because $g'(x) = f(x)$ does not change sign there.</p>	<p>3: $\begin{cases} 1 : x = -1 \text{ relative maximum with justification} \\ 1 : x = 2 \text{ relative minimum with justification} \\ 1 : x = 7 \text{ neither with justification} \end{cases}$</p>										
<p>(c) g is increasing where $g' = f$ is positive.</p> <p>g is concave down where $g' = f$ is decreasing.</p> <p>g is increasing and concave down on the intervals $(-2, -1)$ and $(5, 7)$.</p>	<p>2: $\begin{cases} 1 : \text{answer} \\ 1 : \text{reason} \end{cases}$</p>										
<p>(d) $g(-1) = \int_0^{-1} f(t) dt$</p> $= - \int_{-1}^0 f(t) dt = - \left(-\frac{1}{2}(1)(2) \right) = 1$	<p>1: answer</p>										
<p>(e) $g(2) = \int_0^2 f(t) dt$</p> $= - \left(2 \cdot 2 - \frac{1}{4} \cdot \pi \cdot 2^2 \right) = -(4 - \pi)$	<p>2: $\begin{cases} 1 : \text{area of quarter circle} \\ 1 : \text{answer} \end{cases}$</p>										
<p>(f) The absolute maximum value occurs at an endpoint of the interval or a critical point.</p> <p>Consider a table of values.</p> <table border="1" data-bbox="233 1608 623 1864"> <thead> <tr> <th>x</th> <th>$g(x)$</th> </tr> </thead> <tbody> <tr> <td>-2</td> <td>0</td> </tr> <tr> <td>-1</td> <td>1</td> </tr> <tr> <td>2</td> <td>$\pi - 4$</td> </tr> <tr> <td>5</td> <td>$\pi - 4 + \frac{1}{4}\pi 3^2 = \frac{13}{4}\pi - 4$</td> </tr> </tbody> </table> <p>The absolute maximum value of g is $\frac{13}{4}\pi - 4$.</p>	x	$g(x)$	-2	0	-1	1	2	$\pi - 4$	5	$\pi - 4 + \frac{1}{4}\pi 3^2 = \frac{13}{4}\pi - 4$	<p>4: $\begin{cases} 1 : \text{considers } x = -2 \text{ and } x = 5 \\ 1 : \text{considers } x = -1 \text{ and } x = 2 \\ 1 : \text{answer} \\ 1 : \text{justification} \end{cases}$</p>
x	$g(x)$										
-2	0										
-1	1										
2	$\pi - 4$										
5	$\pi - 4 + \frac{1}{4}\pi 3^2 = \frac{13}{4}\pi - 4$										

Solution	Scoring
<p>(g) $g''(6) = \frac{3-0}{5-7} = -\frac{3}{2}$</p>	<p>1 : answer</p>
<p>(h) $g' = f \Rightarrow g$ is differentiable on $0 < x < 2 \Rightarrow g$ is continuous on $0 \leq x \leq 2$</p> <p>Therefore, the Mean Value Theorem can be applied to g on the interval $0 \leq x \leq 2$ to guarantee that there exists a value of d, for $0 < d < 2$, such that $g'(d)$ equals the average rate of change of g over the interval $0 \leq x \leq 2$.</p>	<p>2 : $\begin{cases} 1 : \text{conditions} \\ 1 : \text{conclusion using Mean Value Theorem} \end{cases}$</p>
<p>(i) $\lim_{x \rightarrow 0} (3x + g(x)) = 0$ $\lim_{x \rightarrow 0} \sin x = 0$</p> <p>Therefore the limit $\lim_{x \rightarrow 0} \frac{3x + g(x)}{\sin x}$ is in the indeterminate form $\frac{0}{0}$ and L'Hospital's Rule can be applied.</p> $\lim_{x \rightarrow 0} \frac{3x + g(x)}{\sin x} = \lim_{x \rightarrow 0} \frac{3 + g'(x)}{\cos x} = \frac{3 + g'(0)}{\cos 0}$ $= \frac{3 + f(0)}{\cos 0} = \frac{3 + -2}{1} = 1$	<p>3 : $\begin{cases} 1 : \text{conditions for L'Hospital's Rule} \\ 1 : \text{applies L'Hospital's Rule} \\ 1 : \text{answer} \end{cases}$</p>
<p>(j) $h'(x) = 1 \cdot g(x^2) + x \cdot g'(x^2) \cdot 2x$ $= g(x^2) + 2x^2 f(x^2)$</p> <p>$h'(\sqrt{2}) = g(2) + 2 \cdot 2 \cdot f(2)$ $= (\pi - 4) + 4 \cdot 0 = \pi - 4$</p>	<p>3 : $\begin{cases} 1 : \text{product rule} \\ 1 : \text{chain rule} \\ 1 : \text{answer} \end{cases}$</p>
